$\mathbf{Q}\mathbf{1}$

Construct a sequence of 16 positive integers that has no increasing or decreasing subsequence of five terms.

Solution: 4,3,2,1,8,7,6,5,12,11,10,9,16,15,14,13.

$\mathbf{Q2}$

What is the coefficients of x^8, x^9 and x^{10} in $(2-x)^{19}$? Solution:

$$(2-x)^{19} = \dots + {19 \choose 8} \cdot 2^{11} \cdot (-1)^8 \cdot x^8$$

$$+ {19 \choose 9} \cdot 2^{10} \cdot (-1)^9 \cdot x^9$$

$$+ {19 \choose 10} \cdot 2^9 \cdot (-1)^{10} \cdot x^{10}$$

$$+ \dots$$

$\mathbf{Q3}$

Let n be a positive integer. Show that

$$\binom{2n}{n+1} + \binom{2n}{n} = \binom{2n+2}{n+1}/2$$

Proof: From the property of combination: $\binom{n}{k} + \binom{n}{k-1} = \binom{n+1}{k}$, we deduce:

$$\binom{2n}{n+1} + \binom{2n}{n} = \binom{2n+1}{n+1}$$

$$= \frac{1}{2} \left[\binom{2n+1}{n} + \binom{2n+1}{n+1} \right]$$

$$= \frac{1}{2} \binom{2n+2}{n+1}$$

Q4

Give a combinatorial proof that

$$\sum_{k=1}^{n} k \binom{n}{k} = n \cdot 2^{n-1}$$

Proof: Let's count in two ways the number of ways to select a committee and to then select a leader of the committee out of n people.

First, if we consider the committee by the scale of people. For a k-people committee, then the cases are first choose k people, namely $\binom{n}{k}$; then there are k chances to pick a leader out of all of them, and thus, the answer should be $k\binom{n}{k}$. Let k iterate from 1 to n, then the total sum should be $\sum_{k=1}^{n} k\binom{n}{k}$.

From a different perspective, we first pick a leader then there are n choices in total, then for the rest n-1 people, they are either in the committee or not, so there are 2^{n-1} cases, put the 2 parts together, we get $n \cdot 2^{n-1}$. \square

Q_5

In how many ways can a $2 \times n$ rectangular checkerboard be tiled using 1×2 and 2×2 pieces? **Solution**: Denote F[n] as the answer for the $2 \times n$ case.

- (I) Base case n = 1. F[1] = 1.
- (II) Base case n = 2. F[2] = 3.
- (III) Common case for $n \geq 3$.

If we use 1×2 blocks, then there are 2 ways. If put it **vertically**, then F[n-2]; if put it **horizontally**, then F[n-1].

If we use 2×2 block, then F[n-2].

In total, F[n] = F[n-1] + 2F[n-2].

Solving it, we get $F[n] = \frac{2}{3} \cdot 2^n + \frac{1}{3} \cdot (-1)^n$.

Q6

(a) Find the recurrence relation satisfied by R_n , where R_n is # regions that a plane is divided into by n lines, if no two of the lines are parallel and no three of the lines go through the same point.

Solution: It's easy to see that $R_n = R_{n-1} + n$ where $R_1 = 2$.

(b) Find R_n using iteration.

Solution:
$$R_n = R_{n-1} + n = R_{n-2} + (n-1) + n = R_1 + 2 + \dots + (n-1) + n = 1 + n(n+1)/2$$
.

$\mathbf{Q7}$

A vending machine dispensing books of stamps accepts only one-dollar coins, \$1 bills, and \$5 bills.

(a) Find a recurrence relation for the number of ways to deposit n dollars in the vending machine, where the order in which the coins and bills are deposited matters.

Solution: Denote F[n] as the ways for the n dollars case. Considering always put the newest item at the end of the sequence, then this ensures iterate all permutations but no repetition.

Then
$$\begin{cases} F[n] = 2F[n-1] & , 0 < n < 5 \\ F[n] = 2F[n-1] + F[n-5] & , n \ge 5 \end{cases}$$

(b) What are the initial conditions?

Solution: F[0] = 1.

(c) How many ways are there to deposit \$10 for a book of stamps?

Solution: By calculation, we get $\mathbf{Ans} = 1217$.

$\mathbf{Q8}$

For bit strings, find a recurrence relation for the number of bit strings of length n that contain an odd number of 0s.

Solution: Denote F[n,0] as the number of cases where there exists even 0s, and F[n,1] for the odd case. Then we can get the recurrence relation:

$$F[n,0] = F[n-1,0] + F[n-1,1]$$

$$F[n,1] = F[n-1,0] + F[n-1,1]$$

And the initial condition, F[1,0] = F[1,1] = 1.

$\mathbf{Q}9$

Given two strings A and B, we need to find the minimum number of operations which can be applied on A to convert it to B. The operations are:

- a. Edit Change a character to another character;
- b. Delete Delete a character;
- c. Insert Insert a character.

The **edit distance** of two strings is defined by the minimum # operations required to transform one string into the other. For the following two strings, their edit distance is 3.

Please utilize the dynamic programming to compute the edit distance between two strings A and B.

(a) Define the subproblems for DP; Denote F[i, j] as the minimum # operations required to let the former i letters of string A and former j letters of string B be the same. (b) Find the recurrence;

Denote A[i] as the *i*th letter of string A.

If A[i] = B[j], then there is no need to make any change and thus F[i, j] = F[i-1, j-1]. If $A[i] \neq B[j]$, we have 3 approaches:

- Edit Then we just need to ensure the former letters are the same aka. $F[i,j] = \min \{F[i,j], F[i-1,j-1]+1\}.$
- **Delete** Then we should make sure the former letters of A should be same as $B[1 \cdots j]$ aka. $F[i,j] = \min \{F[i,j], F[i-1,j] + 1\}.$
- **Insert** Then we should make sure the letters of A is the same as the former letters of string B aka. $F[i,j] = \min \{F[i,j], F[i,j-1] + 1\}.$

To sum up, we have:

$$F[i,j] = \begin{cases} F[i-1,j-1] &, A[i] = B[j] \\ \min \{F[i-1,j-1], F[i-1,j], F[i,j-1]\} + 1 &, A[i] \neq B[j] \end{cases}$$

Initial condition:

 $\forall i \in \{1, 2, ..., A. \text{length}\}, F[i, 0] = i \text{ and } \forall i \in \{1, 2, ..., B. \text{length}\}, F[0, i] = i.$

(c) Implement the algorithm to return the edit distance of two strings.

Algorithm 1 edit distance of string A and string B

Require: string A, B, length of string $A, B l_A, l_B$

Ensure: the edit distance between string A and B $F[l_A, l_B]$.

```
\begin{array}{l} \textbf{for } i \leftarrow 1 \textbf{ to } l_A \textbf{ do} \\ & F[i,0] = i \\ \textbf{for } i \leftarrow 1 \textbf{ to } l_B \textbf{ do} \\ & F[0,i] = i \\ \textbf{for } i \leftarrow 1 \textbf{ to } l_A \textbf{ do} \\ & \textbf{ for } j \leftarrow 1 \textbf{ to } l_B \textbf{ do} \\ & \textbf{ if } A[i] = B[j] \textbf{ then} \\ & & | F[i,j] = F[i-1,j-1] \\ & \textbf{ else} \\ & & | F[i,j] = \min{(F[i-1,j-1],F[i-1,j],F[i,j-1])} + 1 \end{array}
```

 \triangleright return $F[l_A, l_B]$

Q10

In the knapsack problem we are given a set of n items, where each item i is specified by a size s_i and a value v_i . We are also given a size bound S (the size of our knapsack). The goal is to find the subset of items of maximum total value such that sum of their sizes is at most S (they all fit into the knapsack). To implement a DP algorithm to solve this problem,

(a) Define subproblems;

Denote F[i, j] as the maximum value under the condition where we just use the former i items and the sum of the size doesn't exceed j.

(b) Find the recurrence relation; For the *i*th item, we can either choose or not. Thus, we get

$$F[i,j] = \begin{cases} F[i-1,j] & \text{, if } s_i > j \\ \max\{F[i-1,j], F[i-1,j-s_i] + v_i\} & \text{, if } s_i \le j \end{cases}$$

- (c) Solve the base cases; $\forall i \in \{0, 1, 2, \dots n\}, F[i, 0] = 0.$
- (d) Implement the algorithm to return the solution of the knapsack problem.

Algorithm 2 0-1 knapsack problem

Require: number of item n, max capacity m, item sizes $s[1 \cdots n]$, item value $v[1 \cdots n]$.

Ensure: max value with sizes not exceed capacity F[n, m].

```
\begin{array}{l} \textbf{for } i \leftarrow 0 \textbf{ to } n \textbf{ do} \\ & F[i,0] \leftarrow 0 \\ \textbf{for } i \leftarrow 1 \textbf{ to } n \textbf{ do} \\ & \textbf{ for } j \leftarrow 0 \textbf{ to } m \textbf{ do} \\ & \textbf{ if } s[i] > j \textbf{ then} \\ & & F[i,j] = F[i-1,j] \\ & \textbf{ else} \\ & & F[i,j] = \max \left( F[i-1,j], F[i-1,j-s[i]] + v[i] \right) \end{array}
```

 $\triangleright return \ F[n,m]$

Q11

Solve the following recurrence relations

- (a) $a_n = 5a_{n-1} 6a_{n-2}$ for $n \ge 2$ with $a_0 = 1$ and $a_1 = 0$. Solution: This is a LHR and its
- (b) $a_n = a_{n-1} + 6a_{n-2}$ for $n \ge 2$ with $a_0 = 6$ and $a_1 = 8$.

Q12

The Lucas numbers satisfy the recurrence relation

$$L_n = L_{n-1} + L_{n-2}$$

and the initial conditions $L_0 = 2$ and $L_1 = 1$.

- (a) Show that $L_n = f_{n-1} + f_{n+1}$ for $n = 2, 3, \dots$, where f_n is the n-th Fibonacci number.
- (b) Find an explicit formula for the Lucas numbers.
